**MANUAL FOR THE VISUAL
ASSESSMENT OF ROAD
STRUCTURES**

Draft Standard (DS)

PART B: VISUAL ASSESSMENT GUIDE

August 2020

**Permission is granted to freely copy, print and distribute
this Draft Standard document for industry use.**

This page is intentionally left blank

Foreword

Compiled under the auspices of the:

Committee of Transport Officials (COTO)
Roads Coordinating Body (RCB)
Structures Subcommittee

Published by:

The South African National Roads Agency SOC Limited
PO Box 415, Pretoria, 0001

Disclaimer of liability:

This document, with its Parts, is provided as a Draft Standard (DS) without any warranty of any kind expressed or implied. No warranty or representation is made, either expressed or implied, with respect to fitness of use and no responsibility will be accepted by the Committee or the authors for any losses, damages or claims of any kind, including, without limitation, direct, indirect, special, incidental, consequential or any other loss or damages that may arise from the use of the document.

All rights reserved:

No part of this Draft Standard document may be modified or amended without permission and approval of the Committee of Transport Officials (COTO). Permission is granted to freely copy, print and distribute this Draft Standard document for use by industry.

Existing publication:

Not Applicable

Document versions:

Draft Standard (DS). The Draft Standard will be implemented in industry for a period of two (2) years, during which written comments may be submitted to the COTO subcommittee. Draft Standards (DS) have full legal standing.

Final Standard (FS). After the two-year period, comments received are reviewed and where appropriate, incorporated by the COTO subcommittee. The document is converted to a Final Standard (FS) and submitted by the Roads Coordinating Body (RCB) to COTO for approval as a final standard. This Final Standard is implemented in industry for a period of five (5) years, after which it may again be reviewed. Final Standards (FS) have full legal standing.

Comments:

Comments on this Draft Standard should be provided in writing and e-mailed to admin.coto@durban.gov.za

Please note:

This document and its various Parts will only be available in electronic format.

The Draft Standard (DS) will be made available for download on the South African National Roads Agency SOC Ltd (SANRAL) and Department of Transport websites.

The MS Word version of this document is available from Michael Roux at mproux@csir.co.za.

PLEASE NOTE THAT THE DOCUMENT SHOULD BE PRINTED DOUBLE SIDED SO THAT THE DEFECT DESCRIPTIONS AND DEFECT PHOTOS IN SECTION 1.2 ARE PRINTED ON OPPOSING PAGES FOR EASE OF REFERENCE

Preface

Road authorities in South Africa have an obligation to plan, design, construct and maintain the road network, to protect the public investment in the road infrastructure, to ensure the continued functionality of the transportation system and to promote the safety of traffic on the road network. Authorities also have the obligation to provide a reliable, effective, efficient and integrated transport system that supports the sustainable economic and social development of the country.

Road structures are an integral part of the road network. This Manual provides the official requirement for the visual assessment of road structures on the South African road network. It provides requirements and supporting information for the inventory data capturing, explains the inspection methodology and describes how and by whom inspections for the visual assessment of road structures have to be carried out. It further addresses repair costs calculations.

Structures covered by this manual include:

- Bridges;
- Culverts;
- Retaining Walls;
- Gantries;
- Tunnels;
- Low level bridges;
- Light Masts; and
- Low level river crossings.

The inspection methodology described in this manual is a defects-based system and involves the identification of visual defects on structures and rating these defects in terms of degree, extent of occurrence and relevancy.

The relevancy of defects is very important in the rating process and is considered in terms of structural and functional integrity and the safety of the road user.

This manual is a companion document to the TMH22 Manual on Road Asset Management. The TMH22 manual includes sections on how inspection ratings are used to calculate condition indices for road structures at network level and how to calculate the current asset value of these road structures.

This page is intentionally left blank

Overview of the Manual

TMH19 consists of two separate parts, Part A and Part B.

Part A: Road Structure Management Information covers the following topics:

- Structure Class and Type Definitions;
- Overview of Structures Management System (SMS);
- Inventory Information;
- The DER Rating System;
- Overview of Defects on Structures;
- Inspection Items and Inspection Sheets;
- Inspection Procedure and Quality Assurance; and
- Repair Cost Calculations.

The following additional information is supplied in the appendices:

- Detail of the inventory information that can be captured per structure type, indicating required and optional items;
- Inspection forms to be used for the various structure types; and
- Remedial work activity lists for the various structure types.

Part B is a visual assessment manual intended for use as reference document by structure inspectors to reduce the amount of subjectivity involved in the inspection process. It can also assist in the training of inspectors. It includes sections with photos of defects on the structural elements for the various structure types. These photos are intended to mainly illustrate the Degree rating, but the Extent, Relevancy and Urgency ratings are also shown as examples of these ratings. Descriptions of the various defects are provided.

3.1	DEFECTS THAT SHOULD BE MARKED AS "MAKE SAFE" ITEMS	3-1
3.2	DEFECTS THAT DO NOT WARRANT TO BE MARKED AS "MAKE SAFE" (MS) ITEMS	3-1

Visual Assessment Guide Part B2: Photographic Guide of Defects per Structure Type and Inspection Item

1 Introduction

1.1 Background

The aim of this Visual Assessment Guide is to assist inspectors when doing visual assessments of bridges, culverts, gantries, retaining walls and tunnels. The emphasis of the guide is to provide a benchmark for the rating of the degree (D) of various defects in the DER rating system.

While the visual assessment guide is intended for use by inspectors carrying out visual assessments of structures using the DER-rating methodology, it can also be used for the training of inspectors.

This document consists of a photographic guide of defects per inspection item for the various structure types, with a description of the defects and the degree ratings. The photographs are intended to mainly illustrate the Degree rating, but the Extent; Relevancy; and Urgency ratings are also shown as examples of these ratings.

1.2 Degree Ratings

The **Degree rating (D)** describes how bad or severe is the defect being rated. It is a visual rating that defines the severity of the defect. It is not clouded by the need to consider the consequence of the defect with regards the inspection item and structure concerned. Rating the degree of the defect separately allows for the monitoring of the deterioration of the defect over time.

The possible values for D are given in the table below:

D – Degree						
Not applicable	Unable to inspect	No visible defects	Minor	Moderate	Warning	Severe
X	U	0	1	2	3	4

For each inspection item, a D-rating has to be allocated. If the D-rating is 0; X; or U, then no E-rating and R-ratings are given. If the D-rating is 1; 2; 3 or 4, an E-rating and an R-Rating have to be given.

2 Photographic Guide of Defects per Structure Type and Inspection Item

This section contains photos of defects for all the inspection items of the various structure types. The photos are primarily intended to illustrate the Degree rating, but the Extent, Relevancy and Urgency ratings are also provided as examples of these ratings.

This section currently contains limited photos for retaining walls; gantries; and road tunnels and no photos for light masts, as there have been very few inspections of these structure types in the past. This section will be updated once more inspection photos for these structure types become available.

2.1 Bridge (General)

Item 1 Approach Embankment Defects		
Defect	Observations	D
Scour or erosion of embankment	Scour or erosion is shallow. There is no possibility of local collapse.	1
	Scour or erosion is shallow. Sides appear stable. There is a small possibility of local collapse.	2
	Scour or erosion is deep. There is a possibility of local collapse.	3
	Scour or erosion is deep. Sides are vertical or overhanging. Sides appear unstable. There is a real possibility of local collapse, which would endanger the roadway.	4
Settlement of approach fill	Settlement is not more than 50 mm.	1
	Settlement is greater than 50 mm but smaller than 100 mm.	2
	Settlement is more than 50 mm but smaller than 100mm. There is an abrupt step of the same magnitude in the riding surface at the abutment screen (bearing sill) wall.	3
	Settlement is greater than 100 mm. There is an abrupt step of the same magnitude in the riding surface at the abutment bearing sill wall.	4
Kerbs, berms and/or down chutes	Kerbs, berms or down chutes are ineffective due to the collection of debris and/or vegetation or due to minor damage.	1
	Kerbs, berms or down chutes are moderately damaged.	2
	The damage on kerbs, berms or down chutes has reached a warning state.	3
	Kerbs, berms or down chutes are severely damaged.	4
Trees and vegetation	Trees and vegetation can be detrimental to the integrity of the approach embankment as well as contribute to reduced site distances etc.	
	Minor	1
	Moderate	2
	Warning	3
	Severe	4

Item 1: Approach Embankment Defect Photos		
D = 1		
Left DER-U 121-1		
Right DER-U 121-2		
	Erosion alongside bridge stone pitching	Erosion behind wing wall
D = 2		
Left DER-U 222-3		
Right DER-U 222-2		
	Settlement of approach fill – 50 to 100mm	Erosion encroaching on road
D = 3		
Left DER-U 323-4		
Right DER-U 333-3		
	Deep scour encroaching on road	Deep erosion behind wing wall
D = 4		
Left DER-U 443-3		
Right DER-U 434-4		
	Major erosion of embankment	Deep scour, sides are vertical or overhanging

Bridge (General)

Item 2 Guardrail Defects		
Defect	Observations	D
Defective guardrail	Guardrails are not attached to the bridge parapet end blocks.	4
	Guardrails are poorly attached to the bridge parapet end blocks.	2-3
	Guardrail posts are cracked or broken.	2-3
	Guardrail posts are missing.	4
	Bolts/nuts are loose.	1-2
	Nuts are missing.	2-3
	Wood spacer blocks are misaligned.	1-2
	Wood spacer blocks are missing.	2-3
	Guardrails are damaged, bent or broken.	1-4
	Guardrails are corroded.	2-3
	Laps need to be reversed.	4

Item 2		Guardrail Defect Photos	
D = 1			
Left DER-U 131-2

	Guardrail extensively damaged	Fix guardrail to NJ barrier	
D = 4			
Left DER-U 413-3			
Right DER-U 414-4			
	Accident resulting in guardrail displacement	Guardrail protrusion into roadway (MS)	

Bridge (General)

Item 3 Waterway Defects		
Defect	Observations	D
Flood debris accumulation	Loose debris accumulating on piers or bridge decks.	1
	Debris accumulation in the form of small branches on piers or on bridge decks.	2
	Debris accumulation in the form of large branches or small trees on piers or on bridge decks.	3
	Debris accumulation in the form of large trees on piers or on bridge decks.	4
Siltation	Siltation reduces the flood capacity of the bridge	
	Moderate	2
	Warning	3
	Severe	4
Vegetation growth within the waterway	Reeds, bushes and trees growing within the bridge waterway reducing the flood capacity of the bridge.	
	Minor (Reeds and bushes)	1
	Moderate (Reeds and bushes)	2
	Warning (Bushes and trees)	3
	Severe (Bushes and trees)	4

Item 3 Waterway Defect Photos

D = 1		
Left DER-U 111-2

Inlets clogged by debris		Debris and tree blocking waterway
D = 4		
Left DER-U 443-4		
Right DER-U 432-3		
Siltation blocks waterway		River relocation

Bridge (General)

Item 4 Approach Embankment Protection Works		
Defect	Observations	D
Defective embankment protection works.	<p>Embankment protection materials can comprise:-</p> <ul style="list-style-type: none"> • Gabion mattresses and/or boxes • Stone pitching • Grouted stone pitching • Interlocking concrete paving blocks • Concrete edge beams and channels • Concrete slabs • Precast concrete retaining blocks • Geocells • Interlocking cellular concrete grass blocks <p>General defects include:-</p>	
	Vegetation growth within the protection works can damage the protection works and is aesthetically a problem.	1-3
	Portions of the protection works are missing or have been damaged; they may have been removed by vandals or have eroded away.	2-3
	Protection works were never provided or have been completely removed. In river bridges the abutment stability may be compromised.	3-4
Scour or erosion of embankment	Scour or erosion is shallow. There is no possibility of local collapse.	1
	Scour or erosion is shallow. Sides appear stable. There is a small possibility of local collapse.	2
	Scour or erosion is deep. There is a possibility of local collapse.	3
	Scour or erosion is deep. Sides are vertical or overhanging. Sides appear unstable. There is a real possibility of local collapse, which would endanger the roadway.	4

Item 4 Approach Embankment Protection Works Photos		
D = 1		
Left DER-U 131-2		
Right DER-U 121-2		
	Vegetation on embankment protection works	Interlocking blocks removed
D = 2		
Left DER-U 242-2		
Right DER-U 232-2		
	Embankment protection works taken away	Stone pitching damaged and under-scoured
D = 3		
Left DER-U 333-3		
Right DER-U 332-2		
	Embankment protection works not provided	Gabion mattress damaged and washed away
D = 4		
Left DER-U 433-3		
Right DER-U 443-3		
	Embankment/slope protection works removed	Embankment protection works washed away

Bridge (General)

Item 5 Abutment Foundation Defects		
Defects	Observations	D
Shrinkage and restraint cracks including AAR (Crack should be cleaned. Its width and if possible its depth ascertained)	Crack is of the order of 0.3 mm with no signs of water leakage or corrosion of reinforcement.	1
	Crack is greater than 0.3 mm but smaller or equal to 0.6 mm with no signs of water leakage or corrosion of reinforcement.	2
	Crack is of the order of 0.6 mm and there are signs of water passing through crack and evidence of corrosion of reinforcement.	3
	Crack is greater than 0.6 mm	4
Shear cracks (Crack should be cleaned. Its width and if possible its depth ascertained)	Crack is visible of the order of 0.1 to 0.2 mm and there are no signs of water leakage or corrosion of reinforcement.	1
	Crack is greater than 0.2 mm but smaller or equal to 0.4 mm with no signs of water leakage or corrosion of reinforcement.	2
	Crack is greater than 0.4 mm with no signs of water leakage or corrosion of reinforcement.	3
	Crack is greater than 0.5 mm and there are signs of water passing through crack and/or evidence of corrosion of reinforcement.	4
Bending cracks (Crack should be cleaned. Its width and if possible its depth ascertained)	Crack is of the order of 0.3 mm with no signs of water leakage or corrosion of reinforcement.	1
	Crack is greater than 0.3 mm but smaller or equal to 0.6 mm with no signs of water leakage or corrosion of reinforcement.	2
	Crack is of the order of 0.6 mm and there are signs of water passing through crack and evidence of corrosion of reinforcement.	3
	Crack is greater than 0.6 mm	4
Honeycombing (If possible, areas of honeycombed concrete must be removed to expose full extent of damage)	Honeycombing is shallow and reinforcement is not visible.	1
	Honeycombing is shallow. Reinforcement is partly exposed. No signs of corrosion.	2
	Reinforcement is fully exposed, with some signs of corrosion; or reinforcement is partly exposed and corroded. Prestress duct is partly exposed.	3
	Reinforcement is exposed and corroded. Prestress duct is exposed.	4
Scour of foundations	Local scour at pier foundation is shallow. Scour has not exposed base of foundation.	1
	Local scour at pier foundation is shallow. Scour has partly exposed base of foundation or piles of piled foundation.	2
	Local scour at pier founded on piles has exposed the piles. Scour has exposed erodible founding material of a spread footing on a small portion of the perimeter of footing.	3
	Scour has exposed erodible founding material of a spread footing which might cause the footing to collapse or settle.	4

Item 5 Abutment Foundation Defect Photos		
D = 1		
Left DER-U 111-2		
Right DER-U 131-2		
	Crack in abutment foundation	Local scour of foundation
D = 2		
Left DER-U 212-2		
Right DER-U 231-2		
	Crack in abutment foundation	Honeycombing in foundation
D = 3		
Left DER-U 323-4		
Right DER-U 332-3		
	Crack in abutment foundation	Scour of abutment foundation
D = 4		
Left DER-U 443-3		
Right DER-U 433-3		
	Vertical crack in abutment foundation	Scour of abutment foundation

Bridge (General)

Item 6 Abutment Defects		
Defects	Observations	D
Spalling (All loose concrete must be broken away to expose extent of spall)	Spalling is shallow and reinforcement is not visible.	1
	Spalling is shallow. Reinforcement is partly exposed. Minor signs of corrosion. Thus spalling not attributable to corrosion.	2
	Reinforcement is partially or fully exposed and corrosion is a problem	3
	Reinforcement is exposed and significantly corroded. Prestress duct is exposed. Section loss.	4
Shrinkage and restraint cracks including AAR (Crack should be cleaned. Its width and if possible its depth ascertained)	Crack is of the order of 0.3 mm with no signs of water leakage or corrosion of reinforcement.	1
	Crack is greater than 0.3 mm but smaller or equal to 0.6 mm with no signs of water leakage or corrosion of reinforcement.	2
	Crack is of the order of 0.6 mm and there are signs of water passing through crack and evidence of corrosion of reinforcement.	3
	Crack is greater than 0.6 mm	4

Item 6 Abutment Defect Photos		
D = 1		
Left DER-U 111-2		
Right DER-U 111-2		
	Crack in abutment wall	Local spall in abutment wall
D = 2		
Left DER-U 211-2		
Right DER-U 222-3		
	Vertical crack in abutment wall	AAR cracking in return wall
D = 3		
Left DER-U 311-2		
Right DER-U 312-3		
	Vertical crack in abutment return wall	Spalling at abutment return wall
D = 4		
Left DER-U 413-3		
Right DER-U 433-3		
	Vertical crack in abutment wall	AAR in abutment wall

Bridge (General)

Item 7 Wing/Retaining Wall Defects		
Defects	Observations	D
Shrinkage and restraint cracks including AAR (Crack should be cleaned. Its width and if possible its depth ascertained)	Crack is of the order of 0.3 mm with no signs of water leakage or corrosion of reinforcement.	1
	Crack is greater than 0.3 mm but smaller or equal to 0.6 mm with no signs of water leakage or corrosion of reinforcement.	2
	Crack is of the order of 0.6 mm and there are signs of water passing through crack and evidence of corrosion of reinforcement.	3
	Crack is greater than 0.6 mm	4
Spalling (All loose concrete must be broken away to expose extent of spall)	Spalling is shallow and reinforcement is not visible.	1
	Spalling is shallow. Reinforcement is partly exposed. Minor signs of corrosion. Thus spalling not attributable to corrosion.	2
	Reinforcement is partially or fully exposed and corrosion is a problem	3
	Reinforcement is exposed and significantly corroded. Section loss.	4

Bridge (General)

Item 8 Surfacing Defects for Bridges and Culverts		
The surfacing area that should be assessed with this inspection item includes only the surfacing area on the bridge deck (between abutment expansion joints) or directly above a culvert. The surfacing area on the approaches or road below the bridge/culvert is not included.		
Defects	Observations	D
Cracking	This could be an indication of failure of the surfacing material, or indicates excessive movement or deterioration of the underlying deck. With time, crumbling of the surfacing material along the edges of the cracks takes place and the ingress of water may lead to loss of adhesion between the surfacing and the deck.	
	The defects in the surfacing will not likely cause an accident on the bridge.	1-2
	The defects in the surfacing could likely cause an accident on the bridge.	3-4
Excessive deformation	This will take place due to the combined effects of traffic and warm weather or due to loss of adhesion at the interface with the deck or waterproofing membrane. When the deformation becomes excessive, it impairs riding quality and in turn can substantially increase the dynamic loading and vibration from moving vehicles.	
	The defects in the surfacing will not likely cause an accident on the bridge.	1-2
	The defects in the surfacing could likely cause an accident on the bridge.	3-4
Loss of skid resistance	Because of polishing under traffic, the surfacing will become more slippery with time and re-treatment of the surface will be required to restore the resistance to skidding. The standard of this resistance on bridges should be high because of the likely serious consequences of skidding accidents on bridges.	
	The defects in the surfacing will not likely cause an accident on the bridge.	1-2
	The defects in the surfacing could likely cause an accident on the bridge.	3-4

Item 8 Surfacing Defect Photos For Bridges And Culverts

D = 1		
Left DER-U 131-1		
Right DER-U 121-1		
	Gravel accumulated on deck	Vegetation growing on deck
D = 2		
Left DER-U 222-2		
Right DER-U 232-2		
	Loss of skid resistance due to bleeding	Cracking of road surface
D = 3		
Left DER-U 322-3		
Right DER-U 323-3		
	Loss of surfacing on deck (potholes)	Large cracks and potholes in surfacing
D = 4		
Left DER-U 414-4		
Right DER-U 423-3		
	Walkway surface panel missing (MS)	Severe cracks and potholes in surfacing

Bridge (General)

Item 9 Superstructure Drainage Defects

Drainage is an important item for inspection, since trapped, ponded, flowing or splashing water can cause damage to the bridge over a long period and represent a safety hazard to traffic. The main defects include the following:

- a. Water stains on beams, slabs, piers and abutments may indicate inadequate drainage systems or leaking expansion joints.
- b. Blocked or inadequate drainage gullies and pipes.
- c. Drain outlets should be checked to ensure that water is not discharged where it may be detrimental to other components of the structure or on traffic below the bridge.
- d. The accumulation of debris in drainage systems.
- e. Wind blowing drainage water on structure.
- f. Drainage gullies/scuppers should be able to drain water from the deck surface. Resurfacing operations may restrict or block the water flow.
- g. In voided decks, drain pipes should be provided to remove water from the lowest points of voids.

Defects	Observations	D
Drain is partly silted up.	Water flow is restricted but drain is still functional.	1
Drain is in the order of 50% blocked.	Water flow is restricted.	2
Drain is almost completely blocked.	Water flow severely restricted.	3
Drain is completely blocked up or not provided where required.	No water flow can take place. Ponding may occur causing aquaplaning at high speed.	4
Drain pipes not protruding past deck soffit.	Result in streaking and staining of deck. Cyclical wet and dry conditions may aggravate concrete deterioration and result in cracking and spalling, especially where ASR is present in the concrete.	2-4

Item 9 Superstructure Drainage Defect Photos		
D = 1		
Left DER-U 111-2		
Right DER-U 141-2		
	Scupper grid missing	No drip notch provided on cantilever
D = 2		
Left DER-U 242-2		
Right DER-U 212-1		
	Drainage pipes flush with deck soffit	Partly blocked scupper
D = 3		
Left DER-U 333-3		
Right DER-U 343-3		
	No drainage provided with standing water	Surfaced over scupper (only partly open)
D = 4		
Left DER-U 412-4		
Right DER-U 423-3		
	Inlet grid missing (pedestrian safety) (MS)	Spalling aggravated by deck drainage

Bridge (General)

Item 10 Kerb/Sidewalk Defects		
Defects	Observations	D
Spalling (All loose concrete must be broken away to expose extent of spall)	Spalling is shallow and reinforcement is not visible.	1
	Spalling is shallow. Reinforcement is partly exposed. Minor signs of corrosion. Thus spalling not attributable to corrosion.	2
	Reinforcement is partially or fully exposed and corrosion is a problem	3
	Reinforcement is exposed and significantly corroded. Prestress duct is exposed. Section loss.	4
Lack of cover to reinforcement	There are sporadic signs of slight discolouration of concrete face indicating start of reinforcement corrosion due to lack of cover.	1
	There are clear signs of discolouration of concrete face along length of reinforcement bar with small cracks.	2
	Cracks are visible along the length of the reinforcement but with more significant cracks.	3
	Local spalling and extensive cracking and staining due to corrosion of reinforcement.	4
Sidewalk surface defects	Sidewalk surfacing, paving blocks or pre-cast planks are slightly uneven. Pedestrians may trip over uneven surface if they are not careful.	1
	Sidewalk surfacing, paving blocks or pre-cast planks are moderately uneven. Pedestrians will trip over uneven surface.	2
	Sidewalk surfacing, paving blocks or pre-cast planks has subsided or broken. Pedestrians have to walk around subsided areas or in the roadway	3
	Sidewalk surfacing, paving blocks or pre-cast planks, including manhole covers in surface are missing. Condition of sidewalk poses a hazard to pedestrians and may result in serious injury.	4

Bridge (General)

Item 11 Parapet/Handrail Defects		
Defects	Observations	D
Spalling (All loose concrete must be broken away to expose extent of spall)	Spalling is shallow and reinforcement is not visible.	1
	Spalling is shallow. Reinforcement is partly exposed. Minor signs of corrosion. Thus spalling not attributable to corrosion.	2
	Reinforcement is partially or fully exposed and corrosion is a problem	3
	Reinforcement is exposed and significantly corroded. Prestress duct is exposed. Section loss.	4
Shrinkage and restraint cracks including AAR (Crack should be cleaned. Its width and if possible its depth ascertained)	Crack is of the order of 0.3 mm with no signs of water leakage or corrosion of reinforcement.	1
	Crack is greater than 0.3 mm but smaller or equal to 0.6 mm with no signs of water leakage or corrosion of reinforcement.	2
	Crack is of the order of 0.6 mm and there are signs of water passing through crack and evidence of corrosion of reinforcement.	3
	Crack is greater than 0.6 mm	4
Collision damage	Damage is slight, concrete spalling is shallow, steel members are deformed but functional.	1
	Damage is moderate, concrete spalling is deep, steel members are deformed and broken, but parapet or handrail is still functional as a unit.	2
	Damage is major, concrete spalling is deep with reinforcement exposed, steel members are broken or missing, but parapet or handrail is still safe.	3
	Damage is severe, concrete members have failed or are missing, steel members are missing, parapet or handrail is not functional and not safe. "Make safe" action triggered.	4
Lack of cover to reinforcement	There are sporadic signs of slight discolouration of concrete face indicating start of reinforcement corrosion due to lack of cover.	1
	There are clear signs of discolouration of concrete face along length of reinforcement bar with small cracks.	2
	Cracks are visible along the length of the reinforcement but with more significant cracks.	3
	Local spalling and extensive cracking and staining due to corrosion of reinforcement.	4

Item 13 Pier Foundation Defects		
Defects	Observations	D
Scour of foundations	Local scour at pier foundation is shallow. Scour has not exposed base of foundation.	1
	Local scour at pier foundation is shallow. Scour has partly exposed base of foundation or piles of piled foundation.	2
	Local scour at pier founded on piles has exposed the piles. Scour has exposed erodible founding material of a spread footing on a small portion of the perimeter of footing.	3
	Scour has exposed erodible founding material of a spread footing which might cause the footing to collapse or settle.	4
Shrinkage and restraint cracks including AAR (Crack should be cleaned. Its width and if possible its depth ascertained)	Crack is of the order of 0.3 mm with no signs of water leakage or corrosion of reinforcement.	1
	Crack is greater than 0.3 mm but smaller or equal to 0.6 mm with no signs of water leakage or corrosion of reinforcement.	2
	Crack is of the order of 0.6 mm and there are signs of water passing through crack and evidence of corrosion of reinforcement.	3
	Crack is greater than 0.6 mm	4
Shear cracks (Crack should be cleaned. Its width and if possible its depth ascertained)	Crack is visible of the order of 0.1 to 0.2 mm and there are no signs of water leakage or corrosion of reinforcement.	1
	Crack is greater than 0.2 mm but smaller or equal to 0.4 mm with no signs of water leakage or corrosion of reinforcement.	2
	Crack is greater than 0.4 mm with no signs of water leakage or corrosion of reinforcement.	3
	Crack is greater than 0.5 mm and there are signs of water passing through crack and/or evidence of corrosion of reinforcement.	4
Honeycombing (If possible, areas of honeycombed concrete must be removed to expose full extent of damage)	Honeycombing is shallow and reinforcement is not visible.	1
	Honeycombing is shallow. Reinforcement is partly exposed. No signs of corrosion.	2
	Reinforcement is fully exposed, with some signs of corrosion; or reinforcement is partly exposed and corroded. Prestress duct is partly exposed.	3
	Reinforcement is exposed and corroded. Prestress duct is exposed.	4
Bending cracks (Crack should be cleaned. Its width and if possible its depth ascertained)	Crack is of the order of 0.3 mm with no signs of water leakage or corrosion of reinforcement.	1
	Crack is greater than 0.3 mm but smaller or equal to 0.6 mm with no signs of water leakage or corrosion of reinforcement.	2

Item 15 Bearing Defects		
Defects	Observations	D
Corrosion:	Light corrosion on steel components	1
	Corrosion is more extensive but no flaking	2
	Corrosion is flaking but not significantly inhibiting movement	3
	Corrosion has caused bearings to seize	4
Seals and gaiters:	These are slightly damaged	1
	These are extensively damaged, torn or missing	2
	Bearings have deteriorated due to missing or damaged gaiters	3
Debris:	There are birds' nests and other debris around the bearing	1
	Debris is causing damage such as corrosion	2
	Debris is causing significant damage to the bearing	3
Cracks and spalls:	There are shrinkage cracks in the plinths, etc.	1
	These are more extensive but do not compromise the bearing capacity	2
	Cracks and spalls in plinth is extending slightly under the bearing area	3
	These extend well under the bearing area, significantly reducing the capacity of the bearing	4
Elastomeric bearings:	Distortion is >30% of bearing height, minor cracks in the side of the bearings	2
	Distortion is >50% of height or edges are extensively cracked with bearing plates showing corrosion	3
	Distortion is >70% of height or plates have de-bonded with sliding occurring on the plates. Bearing has moved	4
Bearing movement:	Travel lugs or pre-set brackets have not been cut or removed but there is no consequential damage	2
	There is excessive movement at the limit of the bearing capacity	3
	Bearing movement is no longer occurring, compromising the safety of the structure	4
Sliding components:	PTFE sheeting, lead sheets or stainless steel plates are coming out or de-bonding but movement is still occurring	3
	Sliding components are beyond their working range compromising the safety of the bearing and structure	4

Bridge (General)

Item 16 Support Drainage Defects		
<p>The main function of support drainage is to drain water away from the bearings. Ineffective or lack of support drainage will be visible as streaking and staining on the abutment walls.</p> <p>Pier tops should be shaped to drain water (from leaking expansion joints) away from the bearings and not cause ponding of water.</p>		
Defects	Observations	D
Drain is partly silted up.	Water flow is restricted but drain is still functional.	1
Drain is in the order of 50% blocked.	Water flow is restricted.	2
Drain is almost completely blocked.	Water flow severely restricted and ponding water can cause damage to bearings.	3
Drain is completely blocked up or not installed as required.	No water flow can take place and bearings are damaged and not functioning as designed.	4

Bridge (General)

Item 17 Expansion Joint Defects		
Defects	Observations	D
Leaking:	Signs of some minor leaking but no consequential damage to bearings, concrete, steel, etc. below	1
	Signs of more extensive leaking but no damage to bearings, concrete, steel, etc. below	2
	Extensive signs of leaking with damage to bearings, concrete, steel, etc. below	3
	Extensive leaking has caused significant damage such as bearings seizing, extensive concrete spalling, prestressing anchors corroding, etc.	4
Safety:	Some slight spalling and cracking of the joint but no signs of it posing a danger to traffic	1
	Some spalling and cracking of the joint but does not pose a danger to traffic	2
	Parts of the nosing are coming loose but in small pieces. Claws and steel or aluminium components are no longer firmly fixed	3
	Parts of the nosing is coming loose in large pieces, claws and steel or aluminium components are loose, etc. any of which can pose a danger to traffic	4
Asphaltic plug joints:	Some deterioration such as some small cracks, slight rutting etc.	1
	More extensive deterioration such as some cracks, rutting etc.	2
	Large cracks, deep rutting, some loss of joint causing holes	3
	Deep rutting and large holes presenting a danger to traffic	4
Cover-plates:	Slight deterioration to cover plates	1
	More deterioration to cover plates, loose bolts, plates missing over small gaps less than 40 mm etc.	2
	Bolts missing, plates missing over gaps less than 150 mm, etc.	3
	Plates standing out at a dangerous angle, missing plates over large gaps, etc. any of which present a danger to traffic or pedestrians	4

Expansion joints that have closed due to abutment tilting must be recorded as an abutment defect.

On expansion joints which have opened beyond their design limits, record in terms of leaking and safety. In multi-element joints where longitudinal bearer beams are at the limit of their travel and may be coming off the bearing pads, record this as D=4.

For asphalt deterioration or damage adjacent to an expansion joint, record as a surfacing defect

Shrinkage and restraint cracks including AAR (Crack should be cleaned. Its width and if possible its depth ascertained)	Crack is of the order of 0.3 mm with no signs of water leakage or corrosion of reinforcement.	1
	Crack is greater than 0.3 mm but smaller or equal to 0.6 mm with no signs of water leakage or corrosion of reinforcement.	2
	Crack is of the order of 0.6 mm and there are signs of water passing through crack and evidence of corrosion of reinforcement.	3
	Crack is greater than 0.6 mm	4
Scour of outlet structures	Local scour at outlet is shallow. Scour has not exposed base of cut off wall or apron slab.	1
	Local scour at outlet is shallow. Scour has partly exposed base of cut off wall or apron slab.	2
	Local scour at outlet has exposed cut off wall or apron slab. Scour has exposed erodible founding material of outlet structures and some structural damage of cut off wall or apron slab has occurred.	3
	Scour has exposed erodible founding material of outlet structures. Severe structural damage has occurred. Further scour may cause collapse of culvert.	4

Bridge (Cellular) and Major Culvert

Item 2 Wing, Return, Head Wall Defects		
Defects	Observations	D
Shrinkage and restraint cracks including AAR (Crack should be cleaned. Its width and if possible its depth ascertained)	Crack is of the order of 0.3 mm with no signs of water leakage or corrosion of reinforcement.	1
	Crack is greater than 0.3 mm but smaller or equal to 0.6 mm with no signs of water leakage or corrosion of reinforcement.	2
	Crack is of the order of 0.6 mm and there are signs of water passing through crack and evidence of corrosion of reinforcement.	3
	Crack is greater than 0.6 mm	4
Lack of cover to reinforcement	There are sporadic signs of slight discolouration of concrete face indicating start of reinforcement corrosion due to lack of cover.	1
	There are clear signs of discolouration of concrete face along length of reinforcement bar with small cracks.	2
	Cracks are visible along the length of the reinforcement but with more significant cracks.	3
	Local spalling and extensive cracking and staining due to corrosion of reinforcement.	4
Rotation/leaning of wing walls	Marginal, but visible leaning of the wall. Differential displacement at top of wall at joint with abutment, cellular structure or other section of wall is in the order of height / 200 or between 20 mm and 30 mm.	1
	Moderate leaning of the wall. Differential displacement at top of wall at joint with abutment, cellular structure or other section of wall is in the order of height / 150 or between 30 mm and 40mm.	2
	Significant leaning of the wall. Differential displacement at top of wall at joint with abutment, cellular structure or other section of wall is in the order of height / 100 or between 40 mm and 50 mm.	3
	Severe leaning of the wall. There is a large gap between the wall and adjacent structure. Differential displacement at top of wall at joint with abutment, cellular structure or other section of wall is larger than height / 100 or 50 mm.	4

Item 3 Scour Protection Works (In Waterway) Defects		
Defect	Observations	D
Scour or erosion of waterway	Scour or erosion is shallow. There is no possibility of local collapse.	1
	Scour or erosion is shallow. Sides appear stable. There is a small possibility of local collapse.	2
	Scour or erosion is deep. There is a possibility of local collapse.	3
	Scour or erosion is deep. Sides are vertical or overhanging. Sides appear unstable. There is a real possibility of local collapse, which would endanger the roadway.	4
Flood debris accumulation	Loose debris accumulating on piers or bridge decks.	1
	Debris accumulation in the form of small branches on piers or on bridge decks.	2
	Debris accumulation in the form of large branches or small trees on piers or on bridge decks.	3
	Debris accumulation in the form of large trees on piers or on bridge decks.	4
	Siltation significantly reducing capacity of floods at bridge.	2-4
Defective scour protection works.	<p>Scour protection materials can comprise:-</p> <ul style="list-style-type: none"> • Gabion mattresses and/or boxes • Stone pitching • Grouted stone pitching • Interlocking concrete paving blocks • Concrete slabs • Precast concrete retaining blocks • Geocells • Vegetation • Interlocking cellular concrete grass blocks 	
	<p>General defects include:-</p> <p>Vegetation within the protection works to a lesser or larger degree can cause damage to the protection works and is aesthetically a problem.</p>	1-3
	<p>Portions of the protection works are missing; they may have been removed by vandals or have eroded away.</p>	2-3

Item 6 Road Slab Defects		
Defects	Observations	D
Cracking Cracks can be transverse, longitudinal or corner cracks.	Cracks are narrow, not clearly visible and without spalling.	1
	Cracks are wider, clearly visible with some minor spalling.	2
	Cracks are wider, clearly visible with some moderate spalling	3
	Cracks are very wide, clearly visible and with serious spalling.	4
Spalling (All loose concrete must be broken away to expose extent of spall)	Spalling is shallow and reinforcement is not visible.	1
	Spalling is shallow. Reinforcement is partly exposed. Minor signs of corrosion. Thus spalling not attributable to corrosion.	2
	Reinforcement is partially or fully exposed and corrosion is a problem	3
	Reinforcement is exposed and significantly corroded. Section loss.	4

Bridge (Cellular) and Major Culvert

Item 9 Parapet/Handrail Defects		
Defects	Observations	D
Spalling (All loose concrete must be broken away to expose extent of spall)	Spalling is shallow and reinforcement is not visible.	1
	Spalling is shallow. Reinforcement is partly exposed. Minor signs of corrosion. Thus spalling not attributable to corrosion.	2
	Reinforcement is partially or fully exposed and corrosion is a problem	3
	Reinforcement is exposed and significantly corroded. Prestress duct is exposed. Section loss.	4
Shrinkage and restraint cracks including AAR (Crack should be cleaned. Its width and if possible its depth ascertained)	Crack is of the order of 0.3 mm with no signs of water leakage or corrosion of reinforcement.	1
	Crack is greater than 0.3 mm but smaller or equal to 0.6 mm with no signs of water leakage or corrosion of reinforcement.	2
	Crack is of the order of 0.6 mm and there are signs of water passing through crack and evidence of corrosion of reinforcement.	3
	Crack is greater than 0.6 mm	4
Collision damage	Damage is slight, concrete spalling is shallow, steel members are deformed but functional.	1
	Damage is moderate, concrete spalling is deep, steel members are deformed and broken, but parapet or handrail is still functional as a unit.	2
	Damage is major, concrete spalling is deep with reinforcement exposed, steel members are broken or missing, but parapet or handrail is still safe.	3
	Damage is severe, concrete members have failed or are missing, steel members are missing, parapet or handrail is not functional and not safe. "Make safe" action triggered.	4
Lack of cover to reinforcement	There are sporadic signs of slight discolouration of concrete face indicating start of reinforcement corrosion due to lack of cover.	1
	There are clear signs of discolouration of concrete face along length of reinforcement bar with small cracks.	2
	Cracks are visible along the length of the reinforcement but with more significant cracks.	3

Bridge (Cellular) and Major Culvert

Item 10 Wall Defects		
Defects	Observations	D
Shrinkage and restraint cracks including AAR (Crack should be cleaned. Its width and if possible its depth ascertained)	Crack is of the order of 0.3 mm with no signs of water leakage or corrosion of reinforcement.	1
	Crack is greater than 0.3 mm but smaller or equal to 0.6 mm with no signs of water leakage or corrosion of reinforcement.	2
	Crack is of the order of 0.6 mm and there are signs of water passing through crack and evidence of corrosion of reinforcement.	3
	Crack is greater than 0.6 mm	4
Lack of cover to reinforcement	There are sporadic signs of slight discolouration of concrete face indicating start of reinforcement corrosion due to lack of cover.	1
	There are clear signs of discolouration of concrete face along length of reinforcement bar with small cracks.	2
	Cracks are visible along the length of the reinforcement but with more significant cracks.	3
	Local spalling and extensive cracking and staining due to corrosion of reinforcement.	4
Spalling (All loose concrete must be broken away to expose extent of spall)	Spalling is shallow and reinforcement is not visible.	1
	Spalling is shallow. Reinforcement is partly exposed. Minor signs of corrosion. Thus spalling not attributable to corrosion.	2
	Reinforcement is partially or fully exposed and corrosion is a problem	3
	Reinforcement is exposed and significantly corroded. Prestress duct is exposed. Section loss.	4
Honeycombing (If possible, areas of honeycombed concrete must be removed to expose full extent of damage)	Honeycombing is shallow and reinforcement is not visible.	1
	Honeycombing is shallow. Reinforcement is partly exposed. No signs of corrosion.	2
	Reinforcement is fully exposed, with some signs of corrosion; or reinforcement is partly exposed and corroded. Prestress duct is partly exposed.	3
	Reinforcement is exposed and corroded. Prestress duct is exposed. .	4
General concrete deterioration due to aggressive water attack or erosion	Loss of surface mortar and shallow exposure of large aggregate.	1
	Deep erosion of fines and loss of large aggregate in places but without exposure of reinforcement.	2
	Loss of large aggregate, exposure of reinforcement with moderate corrosion.	3
	Severe section loss and significant corrosion of reinforcement.	4

Retaining Walls

Item 3 Wall Defects		
Defect	Observations	D
Spalls and Honeycombing	Spalls and honeycombing is shallow and reinforcement is not visible.	1
	Spalls and honeycombing is shallow. Reinforcement is partly exposed. No signs of corrosion.	2
	Reinforcement is fully exposed, with some signs of corrosion; or reinforcement is partly exposed and corroded.	3
	Reinforcement is exposed and corroded.	4
Concrete cracks	Crack is of the order of 0.3 mm with no signs of water leakage or corrosion of reinforcement.	1
	Crack is greater than 0.3 mm but smaller or equal to 0.6 mm with no signs of water leakage or corrosion of reinforcement.	2
	Crack is of the order of 0.6 mm and there are signs of water passing through crack and evidence of corrosion of reinforcement.	3
	Crack is greater than 0.6 mm	4
Lack of cover to reinforcement	There are sporadic signs of slight discolouration of concrete face indicating start of reinforcement corrosion due to lack of cover.	1
	There are clear signs of discolouration of concrete face along length of reinforcement bar with small cracks.	2
	Cracks are visible along the length of the reinforcement but with more significant cracks.	3
	Local spalling and extensive cracking and staining due to corrosion of reinforcement.	4
Concrete staining	Stained concrete surfaces – minor, moderate.	1
	Stained concrete surfaces – warning, severe.	2-3

3 Make Safe Items

3.1 Defects that should be marked as “Make Safe” Items

If a defect is critical to the structural integrity such that collapse is imminent or where public safety risk is considered high, such a defect should be recorded as Make Safe (MS) and should receive immediate attention. The inspector should immediately alert the authorities to implement appropriate safety measures to ensure the safety of the user. Proof of the communication should be kept clearly indicating the authority and person(s) contacted.

The “Make Safe” box on the inspection form must be ticked.

Examples of defects that should be marked as "Make Safe" items		
D = 4		
Left DER-U 424-4		
Right DER-U 414-4		
	Pavement layer undermined by stormwater	Manhole cover missing in pedestrian walkway
D = 4		
Left DER-U 434-4		
Right DER-U 424-4		
	Impact damage to parapet	Impact damage to parapet
D = 4		
Left DER-U 424-4		
Right DER-U 424-4		
	Impact damage to parapet / end block	Severe erosion at approach embankment
D = 4		
Left DER-U 444-4		
Right DER-U 414-4		
	Missing handrails on pedestrian bridge	Exposed live wiring on pedestrian walkway

Visual Assessment Guide Part B2: Make Safe items

3.2 Defects that do not warrant to be marked as “Make Safe” (MS) items

These examples that were marked as “Make Safe” in previous inspections are defects that should not be regarded as “Make Safe” items. If immediate action is not required to ensure the safety of the road user then these defects should not be marked as “Make Safe” items.

Examples of Defects that should not be marked as "Make Safe" Items

Left DER-U 412-4		
Right DER-U 423-4	Manhole cover missing in median channel	Down chute partly washed away
Left DER-U 333-4		
Right DER-U 222-1	Debris blocking water way	Spacer blocks missing
Left DER-U 212-1		
Right DER-U 111-1	Impact damage to guard rail	Nut missing
Left DER-U 313-3		
Right DER-U 313-1	Guard rail not attached to end block	Scupper blocked and rusted
